ABSTRACT

The research is on the effect of cost of drugs and medicines on milk production in Kenya. The research was carried out as an empirical study. The research is composed of five parts. First, introduction and setting of the problem and objectives of the study. This part serves as the foundation of the study. Second, literature was reviewed. This included the theoretical and empirical literature.

Third, methodology is defined and the data is gathered from various sources mainly from the secondary sources. For a period of eight years thus from 2000-2007.

Fourth the simple linear regression analysis was done. Findings in relation to the objectives of the study was made. The results also of the analyses were described.

Finally the recommendations are drawn according to the results achieved in the study.
